19 Clone distribution: NCI-CGAP clone distribution information can be found through the I.M. A.G. B., Consortium/LNN at:
was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AP129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /organism="Homo sapiens"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Double- stranded cDNA was digested with Real, resulting in blunt ended cDNA of an average 0.1-2 kb in length. Double- stranded cDNA of an average 0.1-2 kb in length. Digested cDNA was split into two sets, one used as is as the driver, the other set was split in half again and each half linked to a different adaptor.

(S.-TCAGACGGCGCCGCGCAGGT-3' or 5'- AGGCGTGGTGGGGGGGGT-1'), to be used as tester. Subtraction was performed using the Clontech PCR Select CDNA subtraction kit. Pool of two mentally normal male individuals ages 41 and 53 (8-124, 8-141) subtracted by pool of two schizophrenic individuals, male age 44 and female age 56 (8-116, 8-118). Tissues were obtained from the Stanley Neuropathology Consortium (www.stanleylab.org Johnston [(410) 614-3918, nlj@welchlink.welch.jhu.edu]."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Suzuki,Y., Taira,H., Teunoda,T., Mizushima-Sugano,J., Sese,J., Hata,H., Ota,T., Isogai,T., Tanaka,T., Morishita,S., Okubo,K., Sakaki,Y., Nakamura,Y., Suyama,A. and Sugano,S.
Diverse transcriptional initiation revealed by fine, large-scale mapping of mRNA start sites
EMBO Rep. 2 (5), 388-393 (2001)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with 74 DNA polymerase and 74 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil 4732114) [ab RAL23072.1], a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with 14 DNA polymerase and 14 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence Sequence Sequence

TITLE OF INVENTION: Assays for the RNA Component of Human
TITLE OF INVENTION: Telomerase
NUMBER OF SEQUENCES: 40
CORRESPONDENCE ADDRESS:
ADDRESSES: Townsend and Townsend and Crew LLP
STREET: Two Embarcadero Center, Eighth Floor
CITY: San Francisco
STREET: California
COUNTRY: USA
ZIP: 94111-3834
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC Compatible
OPERATING STOFFM: Pelosyman H 200
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      OFFRAING SYSTEM: PC-DOS/MS-DOS

                                                                                                                         The present sequence is a PCR primer for a RNA component of human telemerase (RCHT), antisense plasmid. RCHT was derived from a genomic DNA library obtd. from the human lung fibroblast cell line WI-38. The RCHT can be used in the recombinant prodn. of an active telomerase moi., capable of adding sequences to chromosomal DNA telomerase, and in the synthesis of mutant sequences for the detection of mutant mammalian telomerase RNA component to polynucleotides. The RCHT may also be used in the identification of telomerase modulating agents, and in the detection of telomerase modulating agents, and in the detection of telomerase related, or neoplastic conditions in a patient. Polynucleotides of at least 25 consecutive nucleotides identical, or complementary to the RCHT sequence linked to heterologous transcriptional regulatory sequences, can be used for the gene therapy of human diseases.

```
The RNA components of (non) human mammalian telomerase(s) especially from mouse, rat and chinese hamster are all claimed. Antisense oligonucleotides can be used to block the activity of the telomerase; probes and primers can be used in detection; vectors and host cells transformed with the isolated telomerase genes can be used for production of telomerases; RNA and DNA ribozymes and triplex forming oligonucleotides directed against the telomerase genes can be used therapeutically as can plasmids. A mouse which lacks the
          from mouse, rat and chinese hamster are all claimed. Attieuned coligonucleotides can be used to block the activity of the telomerase, probes and primers can be used in detection; vectors and host cells transformed with the isolated telomerase genes can be used for production of telomerases; RNA and DNA ribozymes and triplex forming oligonucleotides directed against the telomerase genes can be used therapeutically as can plasmids. A mouse which lacks the telomerase gene (also claimed) can be used for study of telomere regulation in vivo, and the role it plays in immortalisation. Three primers (AATI1040, AATI1043, MATI1044) were used to produce antisense expression plasmids. A musisense wolson plasmids. A missense molecules.
                                                                                                                                                                                                                                                                                                                                   Gaps
The RNA components of (non) human mammalian telomerase(s) especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RNA components of (non)human mammalian telomerase(s) - useful in studying cell senescence and immortalisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Telomerase; mammal; antisense; triplex forming oligonucleotide; plasmid; probe; primer; ribozyme; ss.

The present invention describes novel Treponema pallidum genes. These genes encode a glycerophosphodiester phosphodiesterase (Gpd), a D15/Oma87 homologue, and proteins with homology to major outer sheath (Msp) proteins of T. denticola. Also described are: (1) an isolated protein capable of inducing a protective immunologic response to T. p. pallidum, T. p. pertenue, or T. p. endemicum, when administered in an acfective amount to an animal host; (2) a method of identifying a T. p. pallidum vaccine candidate; (3) a method of inducing a T. p. pallidum vaccine candidate; (3) a method of inducing a T. p. subspecies pallidum, T. p. subspecies pertenue or T. p. subspecies pallidum, T. p. subspecies pertenue or T. p. subspecies candina (5) a method of determining whether a first and a second cinical isolate of T. p. pallidum are the same or different. The proteins are used, either alone or in combination, in vaccines against Treponemal disease. The methods may be used to identify vaccine other Treponemal diseases. The methods may be used to identify vaccine candidates, and to determine the origin of a treponemal nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel proteins useful in vaccines against syphilis and other treponemal

The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for the rargy of cancer, especially a gene encoding a cytotoxin, for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase repression pathway may cause cactivation or upregulation of telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligonucleotides, canscription factors, peptide nucleic acids and factors that disrupt signal transduction, are useful for cancer therapy. In particular, gene therapy vectors (sepecially poffs2-codAupp) comprising the promoter and a circle promoter and a prodrug cancer therapy under the promoter and a controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of telomerase RNA gene through manipulation of telomerase and the cloning of the controlled or treated.
                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of the hrk gene promoter allows the analysis of therapeutic molecules which modulate hrk promoter activity. Sequences AAZ07681-95 represent PCR primers for amplifying mouse TR gene (terc) promoter sequence.
AAZ33104 to AAZ33156, and AAYS2773 to AAYS2831, represent sequences used in the exemplification of the present invention.

The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked telomerase RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cyclotaxin, for the rapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that gene transcription, are useful for cancer therapy. In particular, gene signal transduction, are useful for cancer therapy. In particular, gene viral thymidine kinase gene can be used to convert a producy e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of telomerase RNA gene through manipulation of telomerase RNA gene through manipulation of the hTR gene promoter allows the analysis of therapeutic molecules which modulate hTR promoter activity, Sequences AA207681-95 represent PCR which modulate hTR promoter activity, Sequences AA207681-95 represent PCR

The present sequence represents a primer used in the isolation of a tic derived cysteine protease. The present invention also describes a tick salivary gland antigen related immunogen and a tick derived serine protease. A nucleotide sequence encoding and of the above proteins can be used in a vaccine against tick carried infections for domestic animals such as cattle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Lyme disease, spirochete, antibacterial, Borrelia, infection, vaccine, Lyme borreliosis, veterinary, PCR, primer, ospA, ss.

The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dystregulation of the telomerase repression pathway may cause reactivation or upregulation of telomerase expression in cancer.

Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligomucleotides, transcription factors, peptide nucleic acids and factors that disrupt thransduction, are useful for cancer therapy. In particular, gene therapy vectors (especially poffs2-codAupp) comprising the promoter and a ciral thymidine kinase gene can be used to convert a producy e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct convert and a controlled or treated. Direct convert and a controlled or treated. Direct convert and a controlled or treated or the cloning of the hTR gene promoter allows the analysis of therapy and the cloning of the hTR gene hTR promoter allows the analysis of therapy and the cloning of the hTR gene hTR promoter allows the analysis of therapy and the cloning or which modulate hTR promoter and a converted to the hTR gene promoter allows the analysis of therapy and the cloning or which modulate hTR promoter and a converted hTR gene promoter allows the analysis of therapy and the cloning or which modulate hTR promoter and a converted hTR gene promoter allows the analysis of therapy and the cloning or which modulate hTR promoter and a converted hTR gene promoter allows the analysis of therapy and the cloning or which modulate hTR gene promoter and a converted hTR gene general promoter and a converted hTR g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Genotyping human galanin receptor gene of an individual for determining haplotype of an individual, involves determining the identity of nucleotide pair at specific polymorphic sites for two copies of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to genotyping human galanin receptor (GALR1) gene of an individual, involving determining for the two copies of the GALR1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Galanin receptor; GALR1; human; single nucleotide polymorphism; SNP; drug discovery; haplotyping; infectious diarrhoea; growth hormone deficiency; allele-specific oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Galanin receptor gene GALR1 allele-specific oligonucleotide #46.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a pharmaceutical composition comprising at least one of: (a) a polypeptide (I) comprising fully defined sequences of ABB77511, ABB77514 or ABB77512 or the corresponding polypeptide from other Borrelia or their immunogenic fragments; (b) nucleic acids (II) that encode (I) or sequences that hybridise with them under stringent conditions; or (c) antibodies directed against (I). The antibodies are used for diagnosis of Borrelia infection (Lyme borreliosis) and in vaccines for treating or preventing Borrelia infections, in human or veterinary medicine. The present sequence is that of a PCR primer for amplification of a Borrelia burgdorferi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                     Pharmaceutical composition comprises Borrelia antigens and encoding nucleic acid, useful for diagnosis, treatment and prevention of Lyme borreliosis .

cc gene present in the individual, the identity of the nucleotide pair at one or more polymorphic sites. The method is useful for determining whether an individual has a haplotype or haplotype pairs defined in the specification. This is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with GALRI activity, e.g., infectious diarrhoea and convert hormone deficiency, to validate GALRI as a candidate agent for treating a specific condition or disease predicted to be associated with GALRI activity, and in the design of clinical trials of candidate drugs converting a specific condition or disease predicted to be associated with GALRI activity. The method is useful to screen for compounds crargeting GALRI to treat a specific conditions or disease associated with GALRI activity. A GALRI polymucleotide or variant is useful in struction and function of GALRI, and in expressing GALRI activity. The polymucleotide or variant is useful for studying expression and function of GALRI, and in expressing GALRI activity of the GALRI isogenes in vivo, for in vivo screening and testing of drugs targeted against GALRI protein, and for studying the variation on the biological activity of GALRI as well as on the binding affiliaty of candidate drugs targeting GALRI for the treatment of infectious diarrhoea and growth hormone insufficiency. AAS98289-
AAS98408 represent human GALRI gene allele-specific oligonucleotides used invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               nvention.

Genotyping human galanin receptor gene of an individual for determining haplotype of an individual, involves determining the identity of nucleotide pair at specific polymorphic sites for two copies of the gene

Claim 16; Page 15; 99pp; English.

gene

```
cof an individual, involving determining for the two copies of the GALRI cene present in the individual, the identity of the nucleotide pair at one or more polymorphic sites. The method is useful for determining cone or more polymorphic sites. The method is useful for determining cone or more polymorphic sites. The method is useful for determining cone or more polymorphic sites. The method is useful for determining conference in the discovery and development of drugs for treating diseases associated with GALRI activity, e.g., infectious diarrhoea and creating a specific condition or disease predicted to be associated with GALRI activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with GALRI activity. The method is useful to screen for compounds traceing GALRI activity. The method is useful to screen for compounds traceing drugs activity. The method is useful to a variant is useful in creating carpression and function of GALRI activity. A GALRI polymucleotide or variant is useful for related to GALRI activity. The polymucleotide or variant is useful for related to GALRI activity. The GALRI isogenes in vivo, for in vivo screening cand testing of drugs targeted against GALRI protein, and for studying the expression of the GALRI isogenes in vivo, for in vivo screening cand testing of drugs targeted against GALRI protein, and for studying the variation on the biological activity of GALRI as well as on the biological activity of GALRI for the treatment cone in the creating of the variation on the biological activity of GALRI is well as on the biological activity of GALRI for the treatment cone in the cone of the variance of the varianc

The sequences given in AAQ49657-707 are antisense oligonucleotides which contain altered inter-sugar linkages, pref. phosphorothionate linkages. These oligomers bind with the protein kinase C (PKC) mRNA at the transcription initiation site, the translation initiation site, the S' cap region, an intron/exon boundary, coding sequences or sequences in the 5'- or 3'-untranslated regions. These oligonucleotides may be used in diagnostics, therapeutics, prophylaxis and as research reagents. The numbers allocated to the oligonucleotides are relative to the first residue to be sequenced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense; oligonucleotide; inter-sugar linkage; protein kinase C; phosphorotchionate linkage; PKC; transcription initiation site; translation initiation site; cap region; intron/exon boundary; diagnosis; therapeutics; prophylaxis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                on the cDNA, which is 28 residues upstream of the ATG start codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Oligo-nucleotide(s) hybridise to nucleic acids encoding Protein kinase C - useful as diagnostics and therapeutics for disease states associated with particular isozymes of PKC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to genotyping human galanin receptor (GALRI) gene of an individual, involving determining for the two copies of the GALRI gene present in the individual, the identity of the nucleotide pair at cone or more polymorphic sites. The method is useful for determining whether an individual has a haplotype or haplotype pairs defined in the specification. This is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with GALRI activity, e.g., infectious diarrhoea and growth hormone deficiency, to validate GALRI as a candidate agent for treating a specific condition or disease predicted to be associated with GALRI activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with GALRI activity. The method is useful to soreen for compounds targeting GALRI activity. The method is useful to a creat disease associated with GALRI activity. The polymucleotide or variant is useful for protein for use in screening for candidate drugs to treat diseases treated to GALRI activity. The polymucleotide or variant is useful for studying expression of the GALRI isogenes in vivo, for in vivo screening and testing of drugs targeted against GALRI for the treatment of fine binding affinity of candidate drugs targeting GALRI for the treatment of interest all and protein for the variation on the biological activity of GALRI activity of interest and the proper of infectious diarrhose and growth hormone insufficiency. Assystance and spreament all activity of interest and the proper of infectious diarrhose and growth hormone insufficiency. Assystance of infectious diarrhose and growth hormone insufficiency and for studying expression of the variation on the biological activity of GALRI descenting the proper of infectious diarrhose and growth hormone insufficiency of candidate drugs targeting diarrhose all spreament all activity of candidate and spreament all act
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

```
/notes "at least one (and preferably all) of
the backbone subunits are composed of N-acetyl
N-(2-aminoethyl)glycine peptide residues, the
nucleobase being attached covalently to the
acetyl group and the peptide linkage being
formed by condensation of the glycine
carboxy group of one residue with the amino
group of the 2-aminoethyl moiety in the next
                         The sequences given in AAQ49657-707 are antisense oligonucleotides which contain altered inter-sugar linkages, pref. phosphorothionate linkages. These oligomers bind with the protein kinase C (PKC) mRNA at the transcription initiation site, the translation initiation site, the 5' cap region, an intron/exon boundary, coding sequences or sequences in the 5'- or 3'-untranslated regions. These oligonucleotides may be used in diagnostics, therapeutics, prophylaxis and as research reagents. The numbers allocated to the oligonucleotides are relative to the first residue to be sequenced on the cDNA, which is 28 residues upstream of the ATG start codon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptide nucleic acid oligomers specific for protein kinase C isozyme(s) - useful as anti:sense molecules for treating PKC mediated disease, e.g. cancer, psoriasis and inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PNA oligomer targetting AUG region of PKC-beta isoforms I & II

of naturally occurring nucleobases covalently bound to a polyamide backbone and (b) hybridise to the translation initiation AUG region, coding region, 5 untranslated region (5' UTR) or 3' untranslated region (5' UTR) or 3' untranslated region (5' UTR) of PKC-alpha or its isoforms. The PNAs can be used to target RNA and single stranded DNA (sBDNA) to produce antisense-type gene regulation moieties. They inhibit expression of PKC-alpha and its isoforms (including beta, gamma, delta, epsilon, zeta and eta) and so are useful for treating and diagnosing cell proliferation and differentation processes such as neoplastic, hyperproliferative and inflammatory diseases.
                                                                                                                                                                                                                                                               and inflammatory diseases.

PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first PNA strand binds with RNA or ssDNA and a second PNA strand binds with the resulting double helix or with the first PNA strand. The PNAs possess no significant charge and are water soluble, which facilitates cellular uptake. Futher, since they contain andes of non-biological amino acids, they are biostable and resistant to enzymatic degradation by proteases. The present sequence targets the AUG region of PKC-beta isoforms I & II.
